I hope this helps A: I did like this: Make sure you have a laptop to do it Get the latest copies of your MS Office (2016, 2013, etc) On your laptop, get a free Microsoft Office site key (it's a download) Get the latest version of Nero Burning ROM Close out all the opened apps Go to Office site key download Open a new file Open the downloaded file Rename the new.nbr file to.exe Close everything open (excepting the File Explorer/Nero) Restart Enjoy your Nero 2016/2013/2012/2011/2010/Office 2007/Office 2003 The lack of significance of the FSH and LH levels may be due to the low concentrations of these hormones in serum and this may be because of the immediate use of the hormone for this study. When we conducted a comparison between the control and experimental groups, we observed a significant decrease in the mean concentrations of serum FSH and LH in the experimental group. Serum sIL-2R is a heterodimeric membrane glycoprotein consisting of a 90-kDa type I transmembrane protein (CD25) and a 50-kDa type II transmembrane protein (CD122). The expression of CD25 on T cells reflects the activation of the T cell surface \[[@cit0014]\]. Cui \*et al\*. \[[@cit0017]\] reported that one of the mechanisms of induction of proteinuria in DN patients is a shift to the proinflammatory phenotype of T cells and activation of the immune response and that this activation is mediated by cytokines. Delgado \*et al\*. \[[@cit0018]\] have shown that CD25 is very important in the pathogenesis of DN and that it is correlated with the degree of proteinuria. In our study, the serum concentrations of sIL-2R and CD25 in the experimental group decreased significantly. These results demonstrate that CD25 is associated with the development and progression of DN. Many studies have found that CD4<sup>+</sup>CD25<sup>+</sup> T cells play an immunosuppressive role in the pathogenesis of DN \[[@cit0019],[@cit0020]\]. The analysis of peripheral blood in patients with DN has found that the frequencies of CD4<sup>+</sup>CD25<sup>+</sup>
