Q: automate a windows console application I have a cmd.exe console application that I would like to automate. The idea is that this application is run at the start of the day, generates a text file, and once the file is generated, deletes itself. But, I do not want the process to run at the start of the day, and if the process needs to be stopped for whatever reason, then I want to have the process shutdown gracefully. A: Put the code to create the file into a function, for example: `public void Main(string[] args) { File.WriteAllText("c:\my\file.txt", "My text here"); }` and then use a timer or some kind of periodic task to call it. A: Use a scheduled task with the Windows Task Scheduler. It's a very easy way to run something at a regular interval, whether it's always running or not. Like millions of other techies around the world. I too have been in the dark and frustrated, for the past few days as the outage was one of the longest I have ever experienced in my career, particularly due to the fact that I have always been on the other side of the fence, simply as an IT auditor, diagnosing and repairing systems, services and other components that had gone wrong or simply needed to be replaced. To my surprise, my in-house support team delivered an outstanding job in the difficult circumstances, and I am currently working with the same team to identify and implement necessary remedies to make sure this does not happen again. However, in my role, I have long felt that moving from traditional tools to SaaS is the way to go. I use the Google Sheets and Excel software for my daily tasks and have found it very effective to overcome some of the challenges I am facing when working on a daily basis. I am now pondering if I can find a similar software to supplement my current work for the short-term. It must be web-based, preferably in English, and offer a similar feature set with the possibility of implementing my in-house developed software. One of the key features of my current in-house software is the ability to populate a SharePoint Workflow in the same sheet and even connect the workflow to external documents and services, such as to perform conditional validation and other
