Paint Paint is a free program for Windows, Macintosh, Linux, and UNIX systems that has been around for many years. It is relatively simple to use, yet provides good image manipulation options. While it doesn't have the power of Photoshop, it is very easy to use, and features non-destructive editing.

1) How Do I Open a Photoshop File? Opening a Photoshop file is quite simple. Choose File -> Open, then navigate to the file you want to open and click the Open button. The Open dialog box will open and allow you to browse to the location of the file on your computer. If the Open dialog box does not open automatically after clicking the Open button, you can use the arrow buttons at the top-right to navigate through the different locations on your computer. Alternatively, you can do one of the following: Double-click the file to open it. Windows: Right click on the file, click Open with (choose the best option from the pop-up menu) and then click Open. Mac: Highlight the file, press Control (Command on a Mac) and click Open. Alternatively you can drag the file from the Finder window into the dialog box. [Note: Windows 10 has the feature that lets you drag files from the Windows File Explorer window into the Open dialog box. See the tips for Windows here.] 2) How Do I Save a Photoshop File? After you've opened the file, and you've adjusted it, then the "File" menu at the top-right of your Photoshop window should have the "Save As..." option selected. Click on this option to save the image into a new file. You can save your file in a variety of ways. Photoshop offers three options: Save the image as a new file type Save the image as a new version of the existing file Save an Open file Choose one of these options: 3) How Do I Save a Photoshop File from the Develop Module? If you're in the Develop module, the "File" menu at the top-right of the file should have the "Save As..." option selected. Click this option and the "Save As..." dialog box will open. 4) How Do I Save a Photoshop File from the History Module? If you're in the History module, the "File" menu at the top-right of the file should have the "Save As..." option selected. Click this option and the "Save As..." dialog box will open. 05a79cecff

Q: Matching string pattern in PHP I have a file containing a bunch of strings, separated by newlines. I'd like to know what lines in the file match a regular expression pattern in the format ..., where is some placeholder for an actual regular expression that the user can enter in. I've tried the following: `if (preg_match("/ .../", file_get_contents($pattern_file))) { echo "True "; } else { echo "False "; }` But I'm getting a Notice: Undefined offset: 1, which would indicate that the expression is not being evaluated correctly. How can I debug this? A: `file_get_contents()` doesn't work the same as `/regex/searchstring/` however, it's generally considered a better idea. `function get_file($filename) { if (file_exists($filename)) { $contents = file_get_contents($filename); } else { return false; } return $contents; } if (preg_match("/ .../", $contents)) { echo "True "; } else { echo "False "; }` If you're trying to pull a version of the pattern from the `$contents` as the pattern string, then you need to pull it out of the returned `$contents`. The `$contents` variable is currently a string, you can use variable variables to grab the part of it you want to use. `$contents = file_get_contents($filename); $pattern = preg_quote($pattern, "/"); $contents = preg_match($pattern, $contents, $matches); if ($contents) { echo "True "; } else { echo "False "; }` In short, you have to perform the matching and retrieving of the

Q: Why is my PHP MySQL Class not running my database query? I am currently studying PHP and as I currently have experience in MYSQL, I am currently working on a database creation class. The issue I have is that my class cannot run a query in the database I created. In this particular example I want to insert a new user into the database and check that the user has been created successfully. I have made sure that the user in the database has been created successfully by doing the following: `mysql_connect("localhost", "root", "root") or die(mysql_error()); mysql_select_db("phpplayer") or die(mysql_error()); mysql_query("insert into users (first_name, middle_name, last_name, username, password) values ('$first_name', '$middle_name', '$last_name', '$username', '$password')"); mysql_query("select * from users where username='$username'");` This prints the username successfully. Here is the code to the class and constructor: `db = new DbConnect(); } public function get($username) { $query = 'select * from users where username="'. $username. "'"; $result = mysql_query($query); $num = mysql_num_rows($result); if ($num == 0) { echo "User Not Found"; } else { // Get the username and password while ($row = mysql_fetch_array($result)) { echo $row['username']; } } } ?>` What I am asking is why does my class not run the query when using the variable `$query` from the constructor. Thanks Ciaran A: `$query` is not defined. Move it below the `mysql_query()` call. `$query = 'select`
