AutoCAD is used by architects, engineers, artists, builders, drafters, animators, and many others to design and document complex 2D and 3D drawings. A regular user may spend hours at a time creating and updating drawings with little effort or interruption. AutoCAD is often compared to AutoCAD LT (for low-end users) and AutoCAD LT/CC (for web or cloud users), and may also be compared to Pro/Engineer, Inventor, and other CAD and drawing software applications. AutoCAD also integrates seamlessly with other Autodesk and non-Autodesk applications. AutoCAD is continually being updated and refined to improve upon existing

features and provide new, innovative features. Although only the desktop AutoCAD version released in 2012 was fully compatible with AutoCAD LT 2013, there are features not available in LT, and LT features are better suited for low-end users. Autodesk recommends that existing LT users upgrade to AutoCAD LT 2013 or higher before attempting to work on AutoCAD LT drawings. Uses AutoCAD can be categorized as follows: Drafting Creating AutoCAD drawings (including plot and profile views) Creating work spaces Creating layout views and layouts Creating assemblies Creating and editing form letters Creating and editing text Creating and editing annotation Creating and editing barcodes Creating and editing data exchange

(DXF) files Creating and editing AutoCAD drawings (only available with AutoCAD LT) For best results, use the exact features AutoCAD offers. Keep in mind that the features offered by some other CAD or drafting applications are not compatible with AutoCAD, and features are not the same for all versions. In addition, some features are less supported with AutoCAD LT and cannot be used with AutoCAD LT. Application Functionality The diagrams and screenshots provided here describe the basic features of AutoCAD that you can expect to find in AutoCAD LT (and AutoCAD LT/CC). If you need help finding specific information, refer to Autodesk's AutoCAD LT 2013 Reference Guide (Autodesk, 2014). Use the following links for reference

Here is my code: List list = new ArrayList(); String[] a = {'a','b','c','d','e'}; String[] b = {"aa","bb","cc","dd","ee"}; list.add(a); list.add(b); Now, I want to map this list into the other arraylist, so that I get: ArrayList abcde = new ArrayList(); abcde.add("aaa","bbb","cc
